coley@mitre.org

Who Am I?

- **MITRE employee for 25+ years (so far)**
- **Started in artificial intelligence**
- **Like many others – fell into computer security**
- **Realized it's a great fit**
 - Always changing
 - Always challenging
 - Many opportunities to (try to) do the right thing
- **"MITRE partners with the government applying systems engineering and advanced technology to address issues of critical national importance."**
 - Values: Commitment to the Public Interest, People in Partnership, Excellence that Counts
 - Top STEM Company for Women, March 2015
 - Top Employer (Workforce Diversity for Engineering & IT Professionals Magazine)
 - Top STEM Employer (Hispanic Network Magazine)
- **<http://www.mitre.org/about/mission-and-values>**

Today's Theme

**There is always a well-known
solution to every human
problem – neat, plausible,
and wrong.**

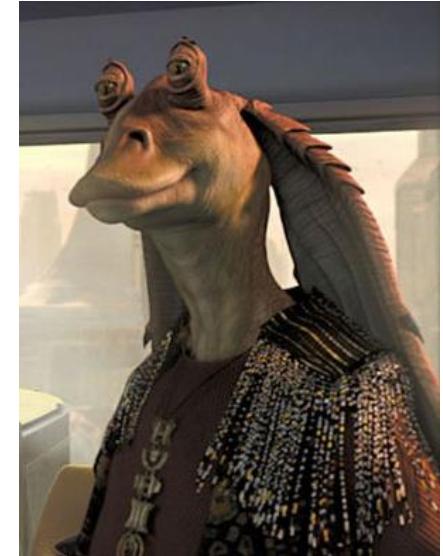

H.L. Mencken

**Sometimes the simple life
Ain't so simple.**

*1980's Van Halen
(the correct lineup)*

Ye Goode Olde Dayes of 1999: Historical Context

- Melissa worm
- The year before Y2K
- Bill Clinton impeached
- Euro currency established
- Wayne Gretzky retires
- SpongeBob Squarepants debuts
- Chandler Riggs (Carl from The Walking Dead) born
- Star Wars: The Phantom Menace introduces the world to Jar Jar Binks

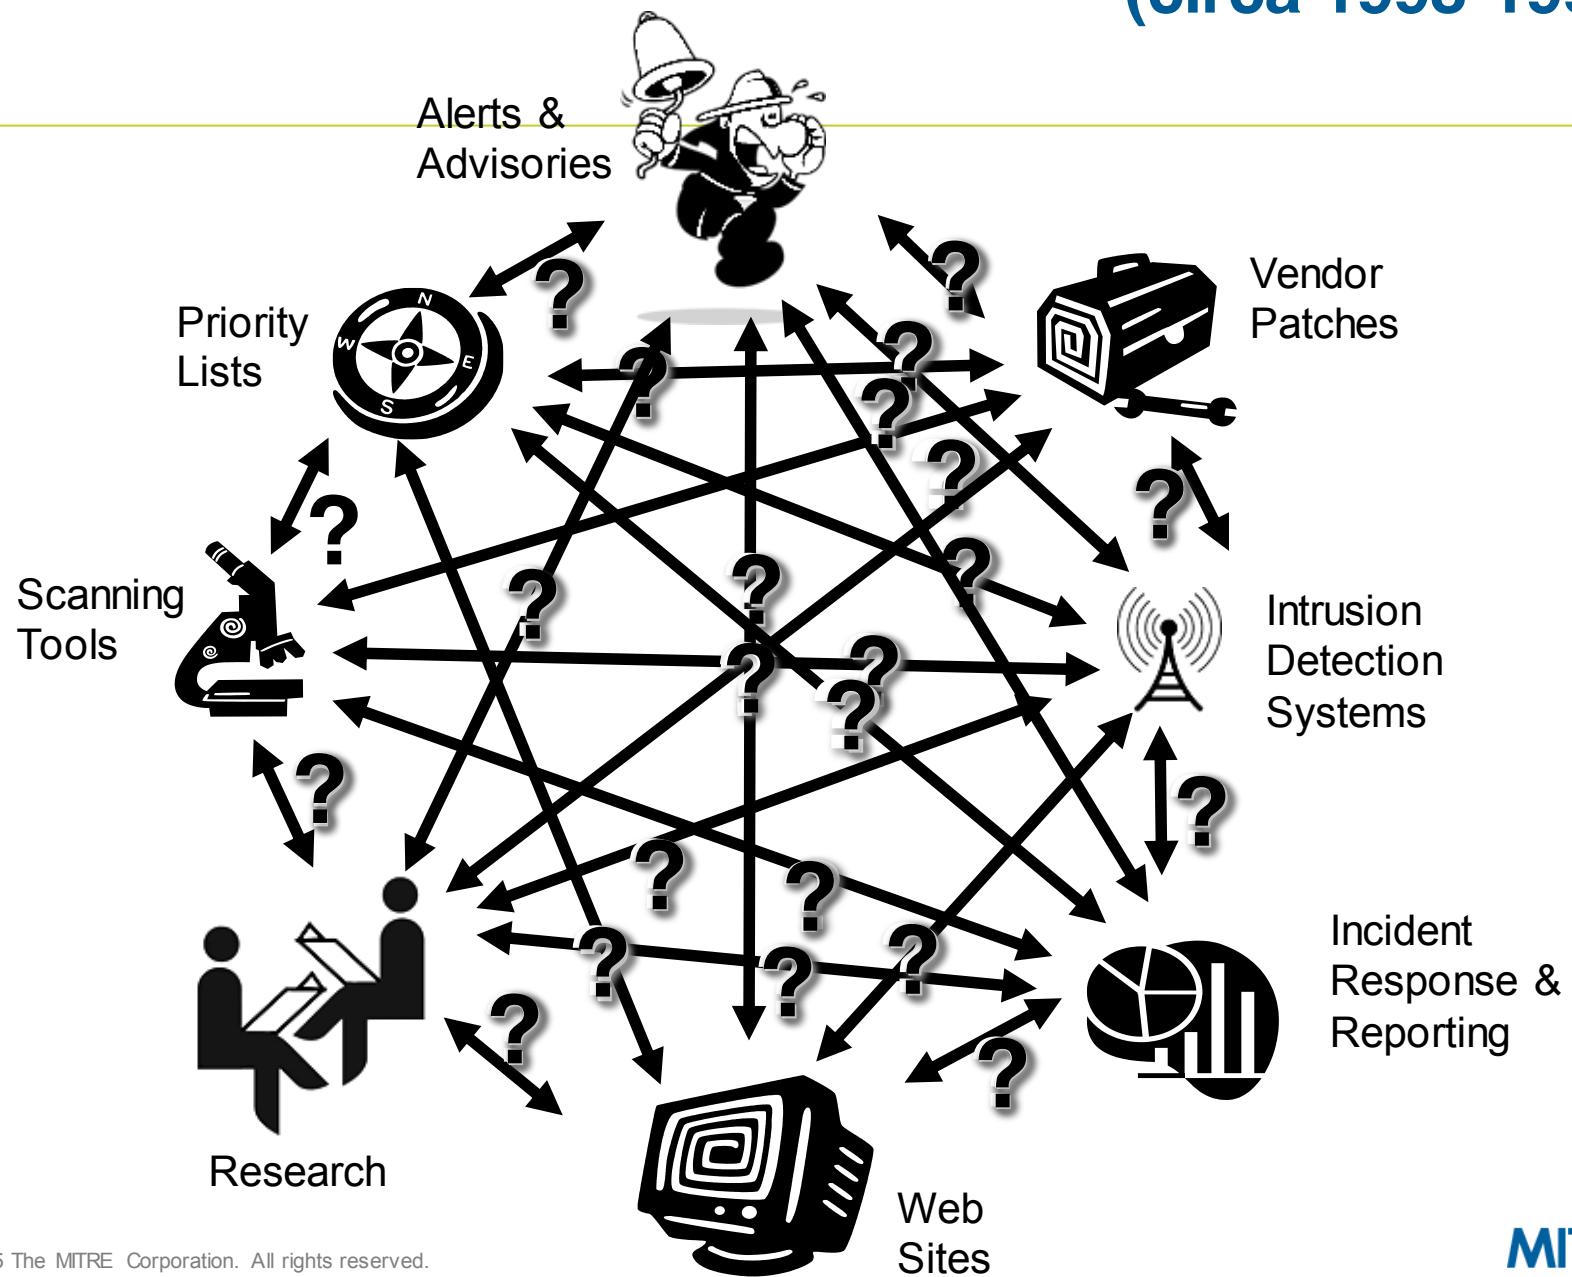

Welcome to 1998

- **Vulnerability databases were mostly private**
 - “We’ll show you our database if you show us your NDA”
- **Bugtraq was a low-traffic list**
- **Full-disclosure and OSVDB didn’t exist**
- **CERT advisories said very little**
- **Exploits were shared privately**
- **Attacks were rampant for months/years**
- **Vendors didn’t fix things for months/years**
- **Vulnerability scanning industry still in infancy**
- **WWW wasn’t ubiquitous**
- **Maybe 10 unique vulnerability types**
- **“Smashing the Stack” was only 2 years old**
- **Most reported vulnerabilities were in servers**

Vulnerability Information Sharing

(circa 1998-1999)

CVE Began with a Challenge at MITRE for 2 of our Technical Staff...

(Vulnerability Management: Circa 1998-1999)

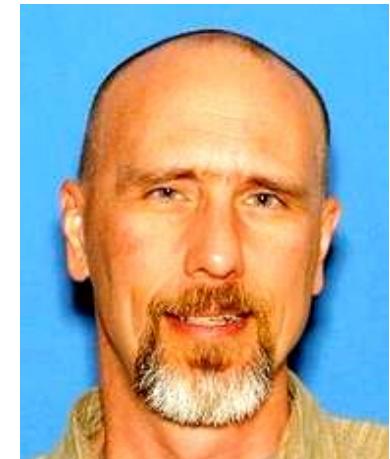

- **How to pick a vulnerability scanning tool?**

- Which one finds more?

- **Are we safe against vulnerabilities listed in CERT advisories?**

- How to match CERT names of vulnerabilities with scanning tool results?

Aha moment on an Exercise Bike in MITRE's Bedford Fitness Center in 1998...

Periodic System

From its origins some 200 years ago, the periodic table has become a vital tool for modern chemists

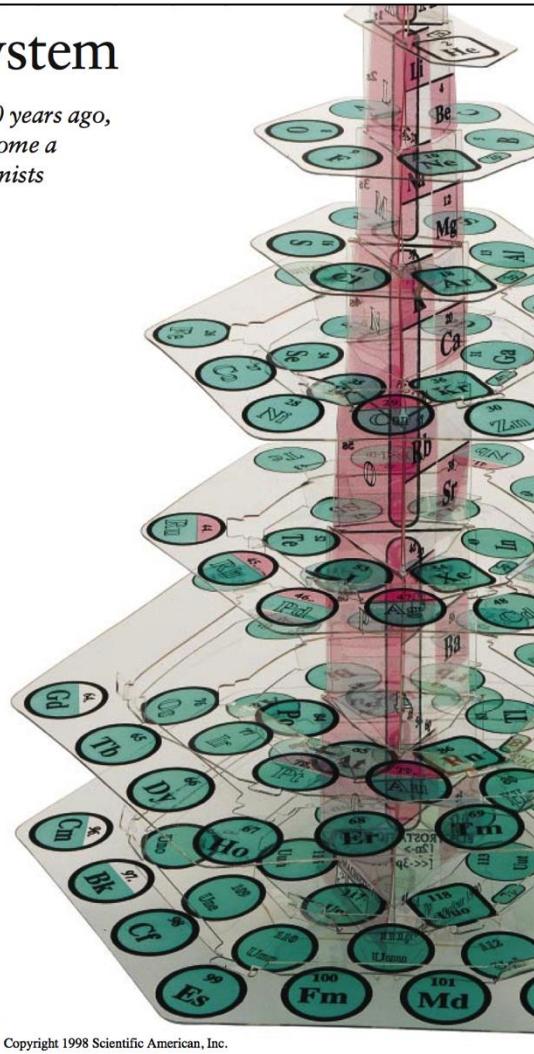

by Eric R. Scerri

The periodic table of the elements is one of the most powerful icons in science: a single document that consolidates much of our knowledge of chemistry. A version hangs on the wall of nearly every chemical laboratory and lecture hall in the world. Indeed, nothing quite like it exists in the other disciplines of science.

The story of the periodic system for classifying the elements can be traced back over 200 years. Throughout its long history, the periodic table has been disputed, altered and improved as science has progressed and as new elements have been discovered [see "Making New Elements," by Peter Armbruster and Fritz Peter Hessbergen, on page 72].

But despite the dramatic changes that have taken place in science over the past century—namely, the development of the theories of relativity and quantum mechanics—there has been no revolution in the basic nature of the periodic system. In some instances, new findings initially appeared to call into question the theoretical foundations of the periodic table, but each time scientists eventually managed to incorporate the results while preserving the table's fundamental structure. Remarkably, the periodic table is thus notable both for its historical roots and for its modern relevance.

The term "periodic" reflects the fact that the elements show patterns in their chemical properties in certain regular intervals. Were it not for the simplification provided by this chart, students of chemistry would need to learn the properties of all 112 known elements. Fortunately, the periodic table allows chemists to function by mastering the properties of a handful of typical elements;

WEIGHTLESSNESS AND HEALTH • NEW ELEMENTS • ATTENTION-DEFICIT DISORDER

SCIENTIFIC AMERICAN

SEPTEMBER 1998 VOL. 269 NO. 3

They are precious clues to the past, rare fossil tracks left millions of years ago by humanity's ancestors.

So why has science buried them?

Towards a Common Enumeration of Vulnerabilities

David E. Mann, Steven M. Christey
The MITRE Corporation
202 Burlington Rd., Bedford MA 01730
{damann, coley}@mitre.org

January 8, 1999

Abstract

In this paper, we discuss the use of multiple vulnerability databases in our operating enterprise security environment and we consider some of the roadblocks we see in achieving interoperability between them. We introduce the concept of a Common Vulnerability Enumeration (CVE) as a mechanism that we believe will help to facilitate easier data sharing. We consider some historical examples of the development of taxonomies in other fields and relate them to current efforts in representing and sharing vulnerability information. We present a simplified representation of a "vulnerability" and discuss how we anticipate using it to mitigate the problem of interoperability. We also describe some of the practical issues that may be involved in the development and use of a CVE.

The Development of a ~~Common Vulnerability~~ Enumeration Vulnerabilities and Exposures List

CVE Entries: Dictionary, not a Database

The screenshot shows a Mozilla Firefox browser window displaying the CVE-2008-2027 entry on the MITRE website. The page has a header with tabs for 'CVE LIST', 'COMPATIBLE PRODUCTS', 'NEWS — MAY 1, 2008', and 'SEARCH'. The main content area features the 'Common Vulnerabilities and Exposures' logo and a 'TOTAL CVEs: 30519' statistic. On the left, there's a sidebar with links to 'About CVE', 'Terminology', 'Documents', 'FAQs', and 'CVE List'. The main content includes:

- 1) Flat Identifier**: A box highlights the 'CVE-ID' section which contains 'CVE-2008-2027 (under review)'.
- 2) Short Description**: A box highlights the detailed description of the vulnerability: "Open redirect vulnerability in WebID/IISWebAgentIF.dll in RSA Authentication Agent 5.3.0.258 for Web for IIS, when accessed via certain browsers such as Mozilla Firefox, allows remote attackers to redirect users to arbitrary web sites and conduct phishing attacks via an ftp URL in the url parameter to a Redirect action."
- 3) External References**: A box highlights the 'REFERENCES' section, which contains a note: "Note: References are provided for the convenience of the reader to help distinguish between vulnerabilities. The list is not intended to be complete." It also lists several references:
 - BUGTRAQ:20080423 PR07-43: Cross-domain redirect on RSA Authentication Agent
 - URL:<http://www.securityfocus.com/archive/1/archive/1/491237/100/0/threaded>
 - MISC:http://www.procheckup.com/vulnerability_PR07-43.php

Microsoft Security Bulletin MS10-071 - Critical

Cumulative Security Update for Internet Explorer (2360131)

Published: October 12, 2010 | Updated: October 13, 2010

Version: 1.1

General Information

Executive Summary

This security update resolves seven privately reported vulnerabilities and three publicly disclosed vulnerabilities in Internet Explorer. The most severe vulnerabilities could allow remote code execution if a user views a specially crafted Web page using Internet Explorer. Users whose accounts are configured to have fewer user rights on the system could be less impacted than users who operate with administrative user rights.

Oracle Critical Patch Update Advisory - October 2010

Description

A Critical Patch Update is a collection of patches for multiple security vulnerabilities. It also includes non-security fixes that are required (because of interdependences) by those security patches. Critical Patch Updates are cumulative, except as noted below, but each advisory describes only the security fixes added since the previous Critical Patch Update. Thus, prior Critical Patch Update Advisories should be reviewed for information regarding earlier accumulated security fixes. Please refer to:

Oracle Database Server Risk Matrix

CVE ID	Component	Protocol	Package and/or Privilege Required	Remote Exploit without Auth.?	CVSS VERSION 2.0 RISK (see Risk Matrix Definitions)							Last Affected Patch set (per Supported Release)	Notes
					Base Score	Access Vector	Access Complexity	Authen-tication	Confiden-tiality	Integrity	Avail-ability		
CVE-2010-2390 (Oracle Enterprise Manager Grid Control)	EM Console	HTTP	None	Yes	7.5	Network	Low	None	Partial+	Partial+	Partial+	10.1.0.5, 10.2.0.3	See Note 1

National Cyber Awareness System

Vulnerability Summary for CVE-2014-0160

Original release date: 04/07/2014

Last revised: 05/23/2014

Source: US-CERT/NIST

Overview

The (1) TLS and (2) DTLS implementation information from process memory via crash bug.

Impact

CVSS Severity (version 2.0):

CVSS v2 Base Score: 5.0 (MEDIUM)

Impact Subscore: 2.9

Exploitability Subscore: 10.0

CVSS Version 2 Metrics:

Access Vector: Network exploitable

Access Complexity: Low

Authentication: Not required to exploit

Impact Type: Allows unauthorized disclosure

CVSS V2 scoring evaluates the impact of a vulnerability based on how easily it can be exploited. It takes into account the nature of the data that is exposed, the ease of exploitation, and the functions of the system. In this case, the exploit allows unauthorized disclosure of sensitive information.

Vulnerability Information Sharing

| 17 |

(circa 1999+)

Content Decisions

- **Explicit guidelines for content of CVE entries**
 - Ensure and publicize consistency within CVE
 - Provide “lessons learned” for researchers
 - Document differences between vulnerability “views”
- **Two basic types**
 - Inclusion: What goes into CVE? What doesn’t, and why?
 - Level of Abstraction: One or many entries for similar issues?
 - Format: How are CVE entries formatted?
- **Difficult to document**
 - “[It’s] like trying to grasp wet corn starch” (Board member)

Incomplete information is the bane of consistency - and content decisions!

Why CVE-2001-0019 Could Identify 1, 2, or 6 Vulnerabilities

- 0 “Shellshock” anyone?
- 0 3 different source code scenarios
- 0 Without actual source, can’t be sure which scenario is true
- 0 Even with source, there are different ways of counting
- 0 Multiple format string problems are especially difficult to distinguish

```
strcpy(arg, long_input);
if (strcmp(cmd, "show") == 0) {
    process_show_command(arg);
} elseif (strcmp(cmd, "clear") == 0) {
    process_show_command(arg);}
```

```
if (strcmp(cmd, "show") == 0) {
    strcpy(str, long_input);
    process_show_command(str);
} elseif (strcmp(cmd, "clear") == 0) {
    strcpy(str, long_input);
    process_clear_command(str); }
```

```
if (strcmp(cmd, "show") == 0) {
    if (strcmp(arg1, "script") == 0) {
        strcpy(str, long_input);
        show_script(str);
    } elseif (strcmp(arg1, "archive") == 0) {
        strcpy(str, long_input);
        show_archive(str);
    } elseif (strcmp(arg1, "log") == 0) {
        strcpy(str, long_input);
        show_log(str);
    }
} elseif (strcmp(cmd, "clear") == 0) {
    if (strcmp(arg1, "script") == 0) {
        strcpy(str, long_input);
        show_script(str);
    } elseif (strcmp(arg1, "archive") == 0) {
        strcpy(str, long_input);
        show_archive(str);
    } elseif (strcmp(arg1, "log") == 0) {
        strcpy(str, long_input);
        show_log(str);
    }
}
```

VDB Abstraction: 1 to 5 Entries?

CVE-1: SQL injection in version 1.x through login.php and order.php.

CVE-2: SQL injection in version 2.x through admin.php.

CVE-3: XSS in version 2.x through login.php and search.php.

ISS and Bugtraq ID

1: Mult. SQL injection in 1.x and 2.x

2: XSS in 2.x

Secunia, ISS, and Bugtraq ID

1: SQL injection and XSS in 1.x and 2.x

Somebody somewhere, probably

1: login.php

2: order.php

3: admin.php

4: search.php

OSVDB

1: SQL injection in login.php

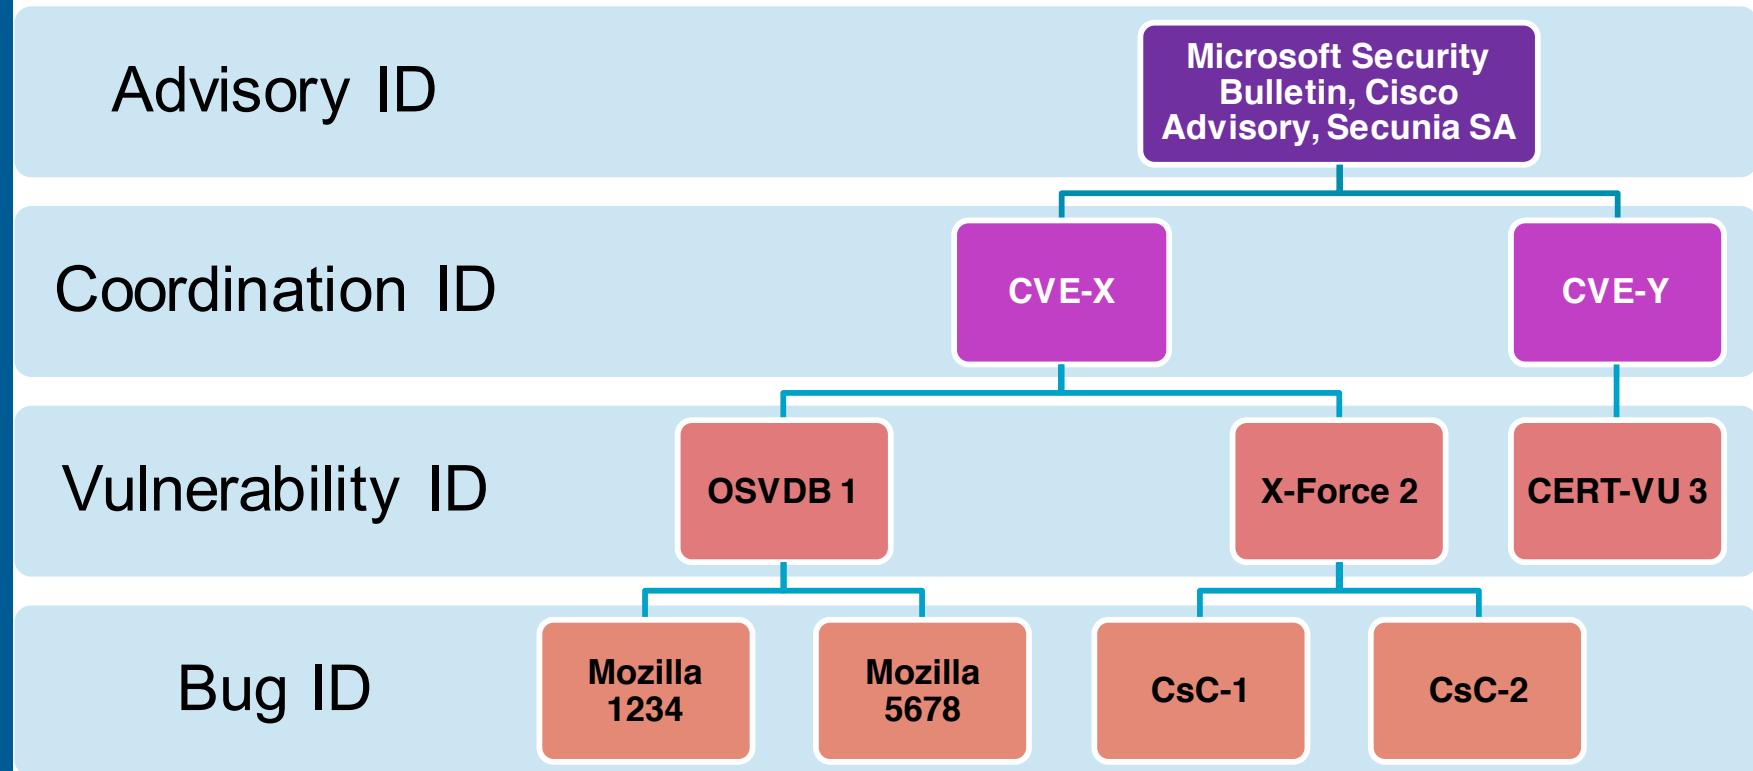

2: SQL injection in order.php

3: SQL injection in admin.php

4: XSS in login.php

5: XSS in search.php

Different Audience → Different Abstraction

- *CVE was always intended as a coordination ID*
- *We originally thought that coordination could operate at the vulnerability level*
- *But, there's too much fluctuation and variation in vulnerability information in the early stages, when coordination ID is most needed*

Content Decisions: Abstraction

- **AB1: SPLIT if different flaw types**
- **AB2: SPLIT if different versions are affected**
- **SPLIT if different vectors are released at a later time**
- **SPLIT if different codebases**
- **Otherwise MERGE**
- **Refinements and/or interpretations of the above**

These factors are generally stable across all phases of vulnerability disclosure, and often known early in the game.

http://cve.mitre.org/cve/editorial_policies/cd_abstraction.html

Content Decisions: Inclusion

- **INCLUDE any issue for software that**
 - Could be deployed in an enterprise
 - Could be network-connected physical devices
 - Has minimal, but non-zero, risk
 - path disclosure, admin-to-SYSTEM, client-side crasher
- **EXCLUDE any issue that**
 - Is “site-specific,” SaaS, hosted, “in the cloud,” ...
 - Is provably wrong
 - Is just a rumor
 - Is not “actionable”
 - Is “just a bug” (e.g. defenestration exploit)

Site-specific / hosted software can be difficult to identify.

Issue: What is a Vulnerability?

- CVE was originally called “Common Vulnerability Enumeration”
- Security tools included many “non-vulnerabilities”
- “Terminological warfare” by Editorial Board in August 1999
 - 2 main debates
 - What is a vulnerability?
 - Should CVE include things that aren’t vulnerabilities?
 - Primary example: running finger (CVE-1999-0612)
 - “Stepping stone” but not directly exploitable
 - Various alternate terms were debated
 - “Exposure” wasn’t being used that often back then, and there was a strong need to keep the CVE acronym, so...
- See:
 - <http://cve.mitre.org/about/terminology.html>
 - <http://cve.mitre.org/board/archives/1999-08/threads.html>

Vulnerability definitions vary widely!

Issue: What is a Real Vulnerability?

- ~50% of all issues are not publicly acknowledged by the vendor
 - <http://cve.mitre.org/board/archives/2000-09/msg00038.html>
- Many vulnerabilities are found in obscure software by unknown researchers without independent confirmation
- Resource-intensive to verify every report
- Some issues don't cross "privilege boundaries"
- Some issues are technically security issues, but extremely low risk
- If it's reported but it may not be real, should it be added to CVE?
 - It will at least be reviewed
 - How much verification is necessary?

0 Extreme example

CVE-1999-0205

Denial of service in Sendmail 8.6.11 and
8.6.12

- Could not be replicated by vendor
- Checked by multiple tools (which may only compare banners)

Candidate Reservation Process

- Request candidate from CNA
- Provide candidate number to vendor and other parties
- Include candidate number in initial public announcement
- Notify MITRE of announcement
- Perform due diligence to avoid duplicate or incorrect candidates
- Should work with affected vendor to increase confidence in correctness of the candidate
- Obtain pool of candidate numbers from MITRE
- Define requirements for researchers to obtain a candidate
- Assign correct number of candidate numbers
- Ensure candidate is shared across all parties
- Do not use candidates in “competitive” fashion
- Primary CNA
- Accessible to researchers via cve-assign@mitre.org
- Educate CNA about content decisions
- Update CVE web site when candidate is publicly announced
- Track potential abuses

Anatomy of a CVE Description: CVE-2009-4623

Multiple PHP remote file inclusion vulnerabilities in Advanced Comment System 1.0 allow remote attackers to execute arbitrary PHP code via a URL in the ACS_path parameter to (1) index.php and (2) admin.php in advanced_comment_system/. NOTE: this might only be a vulnerability when the administrator has not followed installation instructions in install.php.

Flaw type, vendor name, product name, affected versions, remote/local, impact, attack vectors, clarifiers.

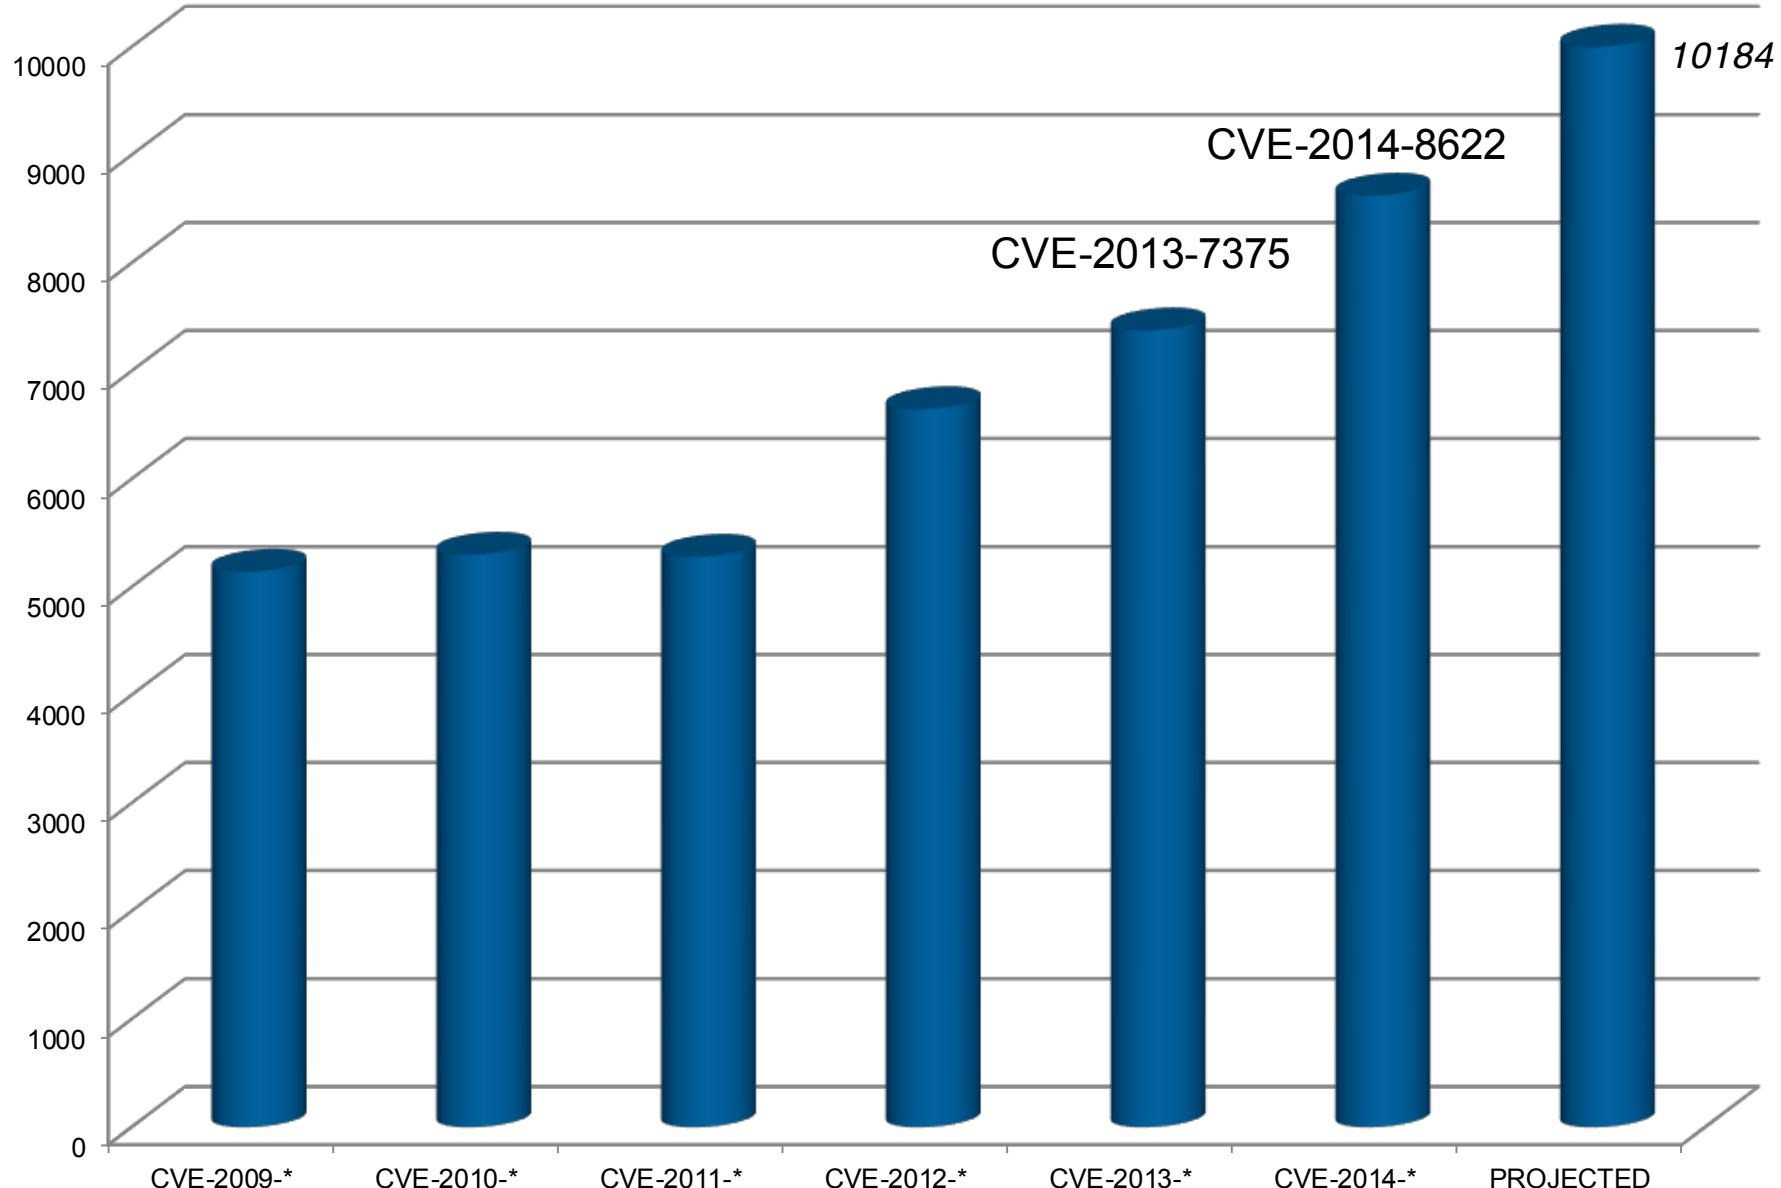

10 Years of CVE Descriptions

CVE	Desc
CVE-1999-0067	CGI phf program allows remote command execution through shell metacharacters.
CVE-2000-0067	CyberCash Merchant Connection Kit (MCK) allows local users to modify files via a symlink attack.
CVE-2001-0067	The installation of J-Pilot creates the .jpilot directory with the user's umask, which could allow local attackers to read other users' PalmOS backup information if their umasks are not securely set.
CVE-2002-0067	Squid 2.4 STABLE3 and earlier does not properly disable HTCP, even when "htcp_port 0" is specified in squid.conf, which could allow remote attackers to bypass intended access restrictions.
CVE-2003-0067	The aterm terminal emulator 0.42 allows attackers to modify the window title via a certain character escape sequence and then insert it back to the command line in the user's terminal, e.g. when the user views a file containing the malicious sequence, which could allow the attacker to execute arbitrary commands.
CVE-2004-0067	Multiple cross-site scripting (XSS) vulnerabilities in phpGedView before 2.65 allow remote attackers to inject arbitrary HTML or web script via (1) descendancy.php, (2) index.php, (3) individual.php, (4) login.php, (5) relationship.php, (6) source.php, (7) imageview.php, (8) calendar.php, (9) gedrecord.php, (10) login.php, and (11) gdbi_interface.php. NOTE: some aspects of vector 10 were later reported to affect 4.1.

10 Years of CVE Descriptions

CVE	Desc
CVE-2005-0067	The original design of TCP does not require that port numbers be assigned randomly (aka "Port randomization"), which makes it easier for attackers to forge ICMP error messages for specific TCP connections and cause a denial of service, as demonstrated using (1) blind connection-reset attacks with forged "Destination Unreachable" messages, (2) blind throughput-reduction attacks with forged "Source Quench" messages, or (3) blind throughput-reduction attacks with forged ICMP messages that cause the Path MTU to be reduced. NOTE: CVE-2004-0790, CVE-2004-0791, and CVE-2004-1060 have been SPLIT based on different attacks; CVE-2005-0065, CVE-2005-0066, CVE-2005-0067, and CVE-2005-0068 are related identifiers that are SPLIT based on the underlying vulnerability. While CVE normally SPLITs based on vulnerability, the attack-based identifiers exist due to the variety and number of affected implementations and solutions that address the attacks instead of the underlying vulnerabilities.
CVE-2006-0067	SQL injection vulnerability in login.php in VEGO Links Builder 2.00 and earlier allows remote attackers to execute arbitrary SQL commands via the username parameter.
CVE-2007-0067	Unspecified vulnerability in the Lotus Domino Web Server 6.0, 6.5.x before 6.5.6, and 7.0.x before 7.0.3 allows remote attackers to cause a denial of service (daemon crash) via requests for URLs that reference certain files.
CVE-2008-0067	Multiple stack-based buffer overflows in HP OpenView Network Node Manager (OV NNM) 7.01, 7.51, and 7.53 allow remote attackers to execute arbitrary code via (1) long string parameters to the OpenView5.exe CGI program; (2) a long string parameter to the OpenView5.exe CGI program, related to ov.dll; or a long string parameter to the (3) getcvdata.exe, (4) ovlaunch.exe, or (5) Toolbar.exe CGI program.
CVE-2009-0067	** RESERVED **
CVE-2010-0067	Unspecified vulnerability in the Oracle Containers for J2EE component in Oracle Application Server 10.1.2.3 and 10.1.3.4 allows remote attackers to affect confidentiality via unknown vectors.

Bug-hunters: They're coming outta the goddamn walls, aargh!

Security boids prep for more and more aliens bursting out of software

By John Leyden, 5 Feb 2013 [Follow](#) { 2,596 followers }

12

The organisation that administers the industry standard for classifying computer system security vulnerabilities wants to prepare its classification system for a world with an even greater number of bugs.

Mitre Corp is considering adding a 100 times more CVE (Common Vulnerabilities and Exposures) slots each year to accommodate bug reports.

RELATED STORIES

- Bug kills Intel gig-E controllers
- Openistas squish security bugs twice as

The current syntax CVE-YYYY-NNNN supports up to 9,999 vulnerabilities. However the increasing number of software flaw

Gartner Catalyst Conference

Yawn. So What?

- If we made a 4-digit assumption, maybe^Wdefinitely others did too
 - A lot of code, processes, & formats use CVE IDs
 - Hundreds of CVE-compatible products in many languages
 - Thousands of “users” across the globe
 - We don’t know where that all is
-
- **CVE is part of the infrastructure**
 - **CVE is everywhere**
 - **People depend on it without even knowing**
 - **People use it in ways we don’t know**
-
- Obligatory Heartbleed (I mean, CVE-2014-0160) reference
 - Which obscure nooks and crannies of the Interwebz has it been found lately?

Where the Wild Things Are

- **Output Format**
 - Wider than 13-character columns
 - Sorting
- **Input Format**
 - Data lengths
 - Structures
 - Search routines
- **Extraction or Parsing**
 - 4-digit assumption, if violated, could trigger silent failure, fatal error, or use of the wrong ID for an unrelated vulnerability

Interpreters Don't Care (‘bout number representation)

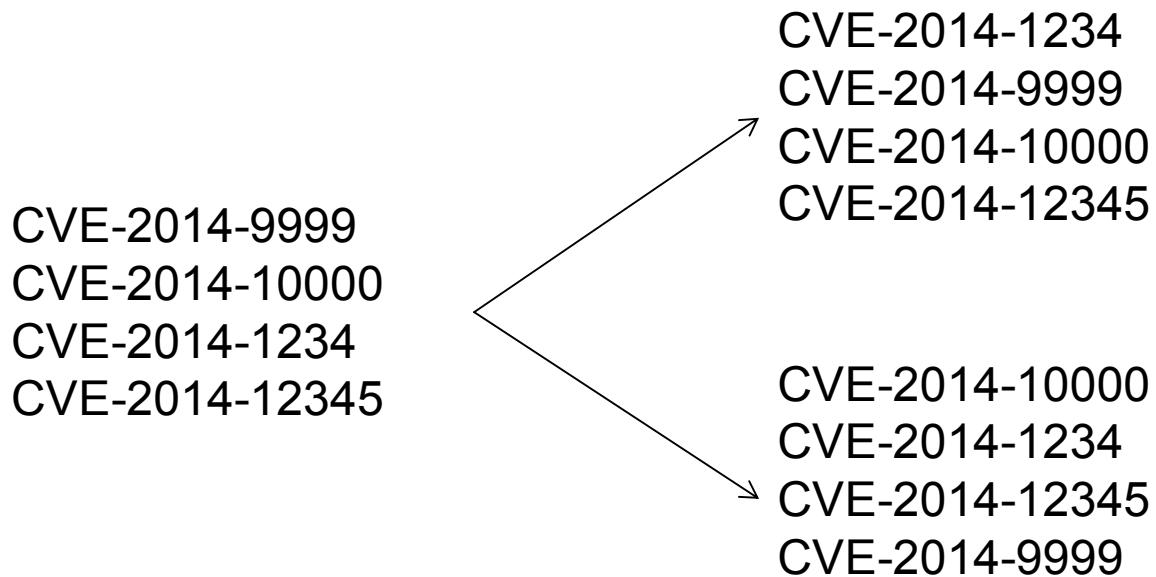

```
# My awesome CVE ID detector in Perl. Shush.  
  
$str = "CVE-2014-839572957648549";  
  
if ($str =~ /CVE-(\d+)-(\d+)/) {  
    $id = sprintf("CVE-%4d-%04d", $1, $2);  
}  
  
else { $id = "PARSE-ERROR"; }  
  
print "ID = $id\n";
```

CVE-2014--001

- Big number that sprintf can't handle? Return -1
- Format -1 with leading zeroes in 4 digits: -001

Sorting

- CVE IDs aren't published in order, but good sorting is aesthetic and sometimes a good visual optimization
- What happens with typical string-only sorting of variable-length IDs?

The New Syntax – Starting January 1, 2014

CVE-YYYY-NNNN...N

- 4-digit minimum in sequence number
- No maximum
- Add extra digits only when needed
- Only leading 0's with 4 digits

MS08-078 and the SDL

Hi, Michael here.

Every bug is an opportunity to learn, and the security update that fixed the data binding bug that affected Internet Explorer users is no exception.

The Common Vulnerabilities and Exposures (CVE) entry for this bug is [CVE-2008-4844](#).

Before I get started, I want to explain the goals of the SDL and the security work here at Microsoft. The SDL is designed as a multi-layered process to help systematically reduce security vulnerabilities; if one component of the SDL process fails to prevent or catch a bug, then some other component should prevent or catch the bug. The SDL also mandates the use of security defenses whose impact will be reflected in the "mitigations" section of a security bulletin, because we know that no software development process will catch all security bugs. As we have said many times, the goal of the SDL is to "Reduce vulnerabilities, and reduce the severity of what's missed."

In this post, I want to focus on the SDL-required code analysis, code review, fuzzing and compiler and operating system defenses and how they fared.

Background

The bug was an invalid pointer dereference in MSHTML.DLL when the code handles data binding. It's important to point out that there is no heap corruption and there is no heap-based buffer overrun!

When data binding is used, IE creates an object which contains an array of data binding objects. In the code in question, when a data binding object is released, the array length is not correctly updated leading to a function call into freed memory.

The vulnerable code looks a little like this (by the way, the real array name is `_aryPXfer`, but I figured `ArrayOfObjectsFromIE` is a little more descriptive for people not in the Internet Explorer team.)

```
int MaxIdx = ArrayOfObjectsFromIE.Size() - 1;
for (int i=0; i <= MaxIdx; i++) {
    if (!ArrayOfObjectsFromIE[i])
        continue;
    ArrayOfObjectsFromIE[i]--TransferFromSource();
    ...
}
```

Here's how the vulnerability manifests itself: if there are two data transfers with the same identifier (so `MaxIdx` is 2), and the first transfer updates the length of the `ArrayOfObjectsFromIE` array when its work was done and releases its data binding object, the loop count would still be whatever `MaxIdx` was at the start of the loop, 2.

This is a time-of-check-time-of-use (TOCTOU) bug that led to code calling into a freed memory block. The Common Weakness Enumeration (CWE) classification for this vulnerability is [CWE-367](#).

The fix was to check the maximum iteration count on each loop iteration rather than once before the loop started. This is the part of the fix for a TOCTOU bug: move the check as close as possible to the action because it

a time-of-check-time-of-use (TOCTOU) bug that led to code calling into a freed memory block. The Common Weakness Enumeration (CWE) classification for this vulnerability is [CWE-367](#).

TOCTOU issues. We will update our training to address this.

Our static analysis tools don't find this because the tools would need to understand the re-entrant nature of the code.

SDL and the CWE/SANS Top 25

Bryan here. The security community has been buzzing since SANS and MITRE's joint announcement earlier this month of their list of the [Top 25 Most Dangerous Programming Errors](#). Now, I don't want to get into a debate in this blog about whether this new list will become the new de facto standard for analyzing security vulnerabilities (or indeed, whether it already has become the new standard). Instead, I'd like to present an overview of how the Microsoft SDL maps to the CWE/SANS list, just May.

Michael and I have written coverage of the Top 25 and believe that the results tell 25 were developed independently from the software analysis white paper and guidance around every major item made many of the same mistakes for you to download and use.

Below is a summary of how see the SDL covers every one of them (race conditions and by multiple SDL requirements) and tools to prevent or detect

CWE	Title	Education?	Manual Process?	Tools?	Threat Model?
20	Improper Input Validation	Y	Y	Y	Y
116	Improper Encoding or Escaping of Output	Y	Y	Y	
89	Failure to Preserve SQL Query Structure (aka SQL Injection)	Y	Y	Y	
79	Failure to Preserve Web Page Structure (aka Cross-Site Scripting)	Y	Y	Y	
78	Failure to Preserve OS Command Structure (aka OS Command Injection)	Y		Y	
319	Cleartext Transmission of Sensitive Information	Y			Y
352	Cross-site Request Forgery (aka CSRF)	Y		Y	
362	Race Condition	Y			
209	Error Message Information Leak	Y	Y	Y	
119	Failure to Constrain Memory Operations within the Bounds of a Memory Buffer	Y	Y	Y	
642	External Control of Critical State Data	Y			Y
73	External Control of File Name or Path	Y	Y	Y	
426	Untrusted Search Path	Y		Y	
94	Failure to Control Generation of Code (aka 'Code Injection')	Y	Y		
494	Download of Code Without Integrity Check				Y
404	Improper Resource Shutdown or Release	Y		Y	
665	Improper Initialization	Y		Y	
682	Incorrect Calculation	Y		Y	
285	Improper Access Control (Authorization)	Y	Y		Y
327	Use of a Broken or Risky Cryptographic Algorithm	Y	Y	Y	
259	Hard-Coded Password	Y	Y	Y	Y
732	Insecure Permission Assignment for Critical Resource	Y	Y		
330	Use of Insufficiently Random Values	Y	Y	Y	
250	Execution with Unnecessary Privileges	Y	Y		Y
602	Client-Side Enforcement of Server-Side Security	Y			Y

What are the Attacks that would be Effective Against Your Weaknesses?

1

CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')

Summary

Weakness Prevalence	High	Consequences	Data loss, Security bypass
Remediation Cost	Low	Ease of Detection	Easy
Attack Frequency	Often	Attacker Awareness	High

Discussion

These days, it seems as if software is all about the data: getting it into the database, pulling it from the database, massaging it into information, and sending it elsewhere for fun and profit. If attackers can influence the SQL that you use to communicate with your database, then suddenly all your fun and profit belongs to them. If you use SQL queries in security controls such as authentication, attackers could alter the logic of those queries to bypass security. They could modify the queries to steal, corrupt, or otherwise change your underlying data. They'll even steal data one byte at a time if they have to, and they have the patience and know-how to do so. In 2011, SQL injection was responsible for the compromises of many high-profile organizations, including Sony Pictures, PBS, MySQL.com, security company HBGary Federal, and many others.

[Technical Details](#) | [Code Examples](#) | [Detection Methods](#) | [References](#)

Prevention and Mitigations

Architecture and Design

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.

For example, consider using persistence layers such as:

Architecture and Design

If available, use structured mechanisms that automatically validate inputs, instead of relying on the developer to do so. Process SQL queries using prepared statements, parameterized queries, and dynamically construct and execute query strings with care.

Architecture and Design, Operation

Run your code using the lowest privileges that are necessary. That way, a successful attack will not immediately compromise the administrator, especially in day-to-day operations. Specifically, follow the principle of least privilege when the requirements of the system indicate that a user needs access to all database objects, such as execute-only for stored procedures.

Architecture and Design

For any security checks that are performed on the input, do not modify values after the checks have been performed.

Implementation

If you need to use dynamically-generated query strings, the most conservative approach is to escape or filter all characters that are still needed, such as white space, wrap each argument in quotes, and use parameterized queries. Instead of building your own implementation, such as a parser, make sure that parameters have certain properties that make them safe to use.

Implementation

Assume all input is malicious. Use an "accept known good" approach where you map known good values into your application.

Implementation

Ensure that error messages only contain minimal details that are useful to the intended audience, and nobody else. The messages need to strike the balance between being too cryptic and not being cryptic enough. They should not necessarily reveal the methods that were used to determine the error. Such detailed information can be used to refine the original attack to increase the chances of success.

If errors must be tracked in some detail, capture them in log messages - but consider what could occur if the log messages can be viewed by attackers. Avoid recording highly sensitive information such as passwords in any form. Avoid inconsistent messaging that might accidentally tip off an attacker about internal state, such as whether a username is valid or not.

In the context of SQL Injection, error messages revealing the structure of a SQL query can help attackers tailor successful attack strings.

Operation

Use an application firewall that can detect attacks against this weakness. It can be beneficial in cases in which the code cannot be fixed (because it is controlled by a third party), as an emergency prevention measure while more comprehensive software assurance measures are applied, or to provide defense in depth.

Effectiveness: Moderate

Notes: An application firewall might not cover all possible input vectors. In addition, attack techniques might be available to bypass the protection mechanism, such as using malformed inputs that can still be processed by the component that receives those inputs. Depending on functionality, an application firewall might inadvertently reject or modify legitimate requests. Finally, some manual effort may be required for customization.

Operation, Implementation

If you are using PHP, configure your application so that it does not use register_globals. During implementation, develop your application so that it does not rely on this feature, but be wary of implementing a register_globals emulation that is subject to weaknesses such as CWE-95, CWE-621, and similar issues.

CAPEC-66: SQL Injection

SQL Injection

Typical Severity: High**Status:** Draft**Attack Pattern ID:** 66 ([Standard](#))**Attack Pattern Completeness:** [Complete](#)**Description****Summary**

This attack exploits target system vulnerabilities to inject SQL statements based on the input provided by the user. An attacker crafts input strings that will be executed by those the application intends to execute. SQL Injection results from failing to validate or sanitize user-controlled input, especially crafted user-controlled input that bypasses validation as part of SQL query construction. SQL injection is always not envisaged during a design of the application, it is a database execute system-related vulnerability that enables an attacker to talk directly to the database completely. Successful injection allows an attacker to read or modify data in the database, extract information from a database, and more.

Attack Execution Flow**Explore****1. Survey application:**

The attacker first takes an inventory of the application.

CAPEC-7: Blind SQL Injection

Blind SQL Injection

Typical Severity: High**Status:** Draft**Description****Summary**

Blind SQL Injection results from an insufficient mitigation for SQL Injection. Although suppressing database error messages are considered best practice, the suppression alone is not sufficient to prevent SQL Injection. Blind SQL Injection is a form of SQL Injection that overcomes the lack of error messages. Without the error messages that facilitate SQL Injection, the attacker constructs input strings that probe the target through simple Boolean SQL expressions. The attacker can determine if the syntax and structure of the injection was successful based on whether the query was executed or not. Applied iteratively, the attacker determines how and where the target is vulnerable to SQL Injection.

For example, an attacker may try entering something like "username' AND 1=1; --" in an input field. If the result is the same as when the attacker entered "username" in the field, then the attacker knows that the application is vulnerable to SQL Injection. The attacker can then ask yes/no questions from the database server to extract information from it. For example, the attacker can extract table names from a database using the following types of queries:

```
"username' AND ascii(lower(substring((SELECT TOP 1 name FROM sysobjects WHERE xtype='U'), 1, 1))) > 108".
If the above query executes properly, then the attacker knows that the first character in a table name in the database is a letter between m and z. If it doesn't, then the attacker knows that the character must be between a and l (assuming of course that table names only contain alphabetic characters). By performing a binary search on all character positions, the attacker can determine all table names in the database. Subsequently, the attacker may execute an actual attack and send something like:
"username'; DROP TABLE trades; --"
```

Attack Execution Flow**Explore****1. Hypothesize SQL queries in application:**

Generated hypotheses regarding the SQL queries in an application. For example, the attacker may hypothesize that his input is passed directly into a query that looks like:

```
"SELECT * FROM orders WHERE ordernum = _____"
or
"SELECT * FROM orders WHERE ordernum IN (_____)"
```

CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')

Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')

▼ Applicable Platforms

Languages

All

Technology Classes

Database-Server

▼ Modes of Introduction

This weakness typically appears in data-rich applications that save user inputs in a database.

▼ Common Consequences

Scope Effect

Confidentiality **Technical Impact:** Read application data

Since SQL databases generally hold sensitive data, loss of confidentiality is a frequent problem with SQL injection vulnerabilities.

Access Control **Technical Impact:** Bypass protection mechanism

If poor SQL commands are used to check user names and passwords, it may be possible to connect to a system as another user with no previous knowledge of the password.

Access Control **Technical Impact:** Bypass protection mechanism

If authorization information is held in a SQL database, it may be possible to change this information through the successful exploitation of a SQL injection vulnerability.

Integrity **Technical Impact:** Modify application data

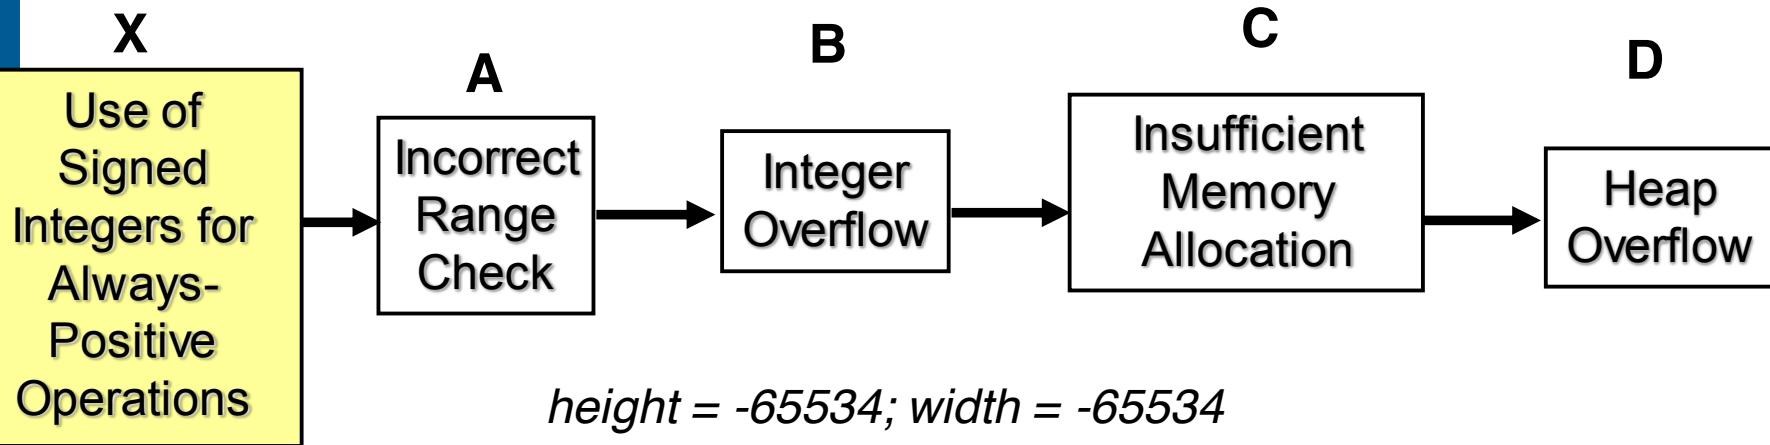

Just as it may be possible to read sensitive information, it is also possible to make changes or even delete this information with a SQL injection attack.

▼ Likelihood of Exploit

Technical Impact	Automated Analysis	Automated Dynamic Analysis	Automated Static Analysis	Black Box	Fuzzing	Manual Analysis	Manual Dynamic Analysis	Manual Static Analysis	White Box
Execute unauthorized code or commands		<u>78</u> , <u>120</u> , <u>129</u> , <u>131</u> , <u>476</u> , <u>805</u>	<u>78</u> , <u>79</u> , <u>98</u> , <u>120</u> , <u>129</u> , <u>131</u> , <u>134</u> , <u>190</u> , <u>426</u> , <u>798</u> , <u>805</u>	<u>79</u> , <u>129</u> , <u>134</u> , <u>190</u> , <u>426</u> , <u>494</u> , <u>698</u> , <u>798</u>		<u>98</u> , <u>120</u> , <u>131</u> , <u>190</u> , <u>426</u> , <u>494</u> , <u>805</u>	<u>476</u> , <u>798</u>	<u>78</u> , <u>798</u>	
Gain privileges / assume identity		<u>601</u>	<u>306</u> , <u>352</u> , <u>426</u> , <u>601</u> , <u>798</u>	<u>259</u> , <u>426</u> , <u>798</u>		<u>259</u> , <u>306</u> , <u>352</u> , <u>426</u>	<u>798</u>	<u>601</u> , <u>798</u> , <u>807</u>	
Read data	<u>209</u> , <u>311</u> , <u>327</u>	<u>78</u> , <u>89</u> , <u>129</u> , <u>131</u> , <u>209</u> , <u>404</u> , <u>665</u>	<u>78</u> , <u>79</u> , <u>89</u> , <u>129</u> , <u>131</u> , <u>134</u> , <u>352</u> , <u>426</u> , <u>798</u>	<u>14</u> , <u>79</u> , <u>129</u> , <u>134</u> , <u>319</u> , <u>426</u> , <u>798</u>		<u>89</u> , <u>131</u> , <u>209</u> , <u>311</u> , <u>327</u> , <u>352</u> , <u>426</u>	<u>209</u> , <u>404</u> , <u>665</u> , <u>798</u>	<u>78</u> , <u>798</u>	<u>14</u>
Modify data	<u>311</u> , <u>327</u>	<u>78</u> , <u>89</u> , <u>129</u> , <u>131</u>	<u>78</u> , <u>89</u> , <u>129</u> , <u>131</u> , <u>190</u> , <u>352</u>	<u>129</u> , <u>190</u> , <u>319</u>		<u>89</u> , <u>131</u> , <u>190</u> , <u>311</u> , <u>327</u> , <u>352</u>		<u>78</u>	
DoS: unreliable execution		<u>78</u> , <u>120</u> , <u>129</u> , <u>131</u> , <u>400</u> , <u>476</u> , <u>665</u> , <u>805</u>	<u>78</u> , <u>120</u> , <u>129</u> , <u>131</u> , <u>190</u> , <u>352</u> , <u>400</u> , <u>426</u> , <u>805</u>	<u>129</u> , <u>190</u> , <u>426</u> , <u>690</u>	<u>400</u>	<u>120</u> , <u>131</u> , <u>190</u> , <u>352</u> , <u>426</u> , <u>805</u>	<u>476</u> , <u>665</u>	<u>78</u>	
DoS: resource consumption		<u>120</u> , <u>400</u> , <u>404</u> , <u>770</u> , <u>805</u>	<u>120</u> , <u>190</u> , <u>400</u> , <u>770</u> , <u>805</u>	<u>190</u>	<u>400</u> , <u>770</u>	<u>120</u> , <u>190</u> , <u>805</u>	<u>404</u>	<u>770</u>	<u>412</u>

Hide activities	<u>327</u>	<u>78</u>	<u>78</u>			<u>327</u>		<u>78</u>	

**Challenges and complexities...
or, why some vulnerabilities are still
with us**

Chains: Why Buffer Overflows are Still Here

Assumption: the range check will prevent an overflow from occurring.

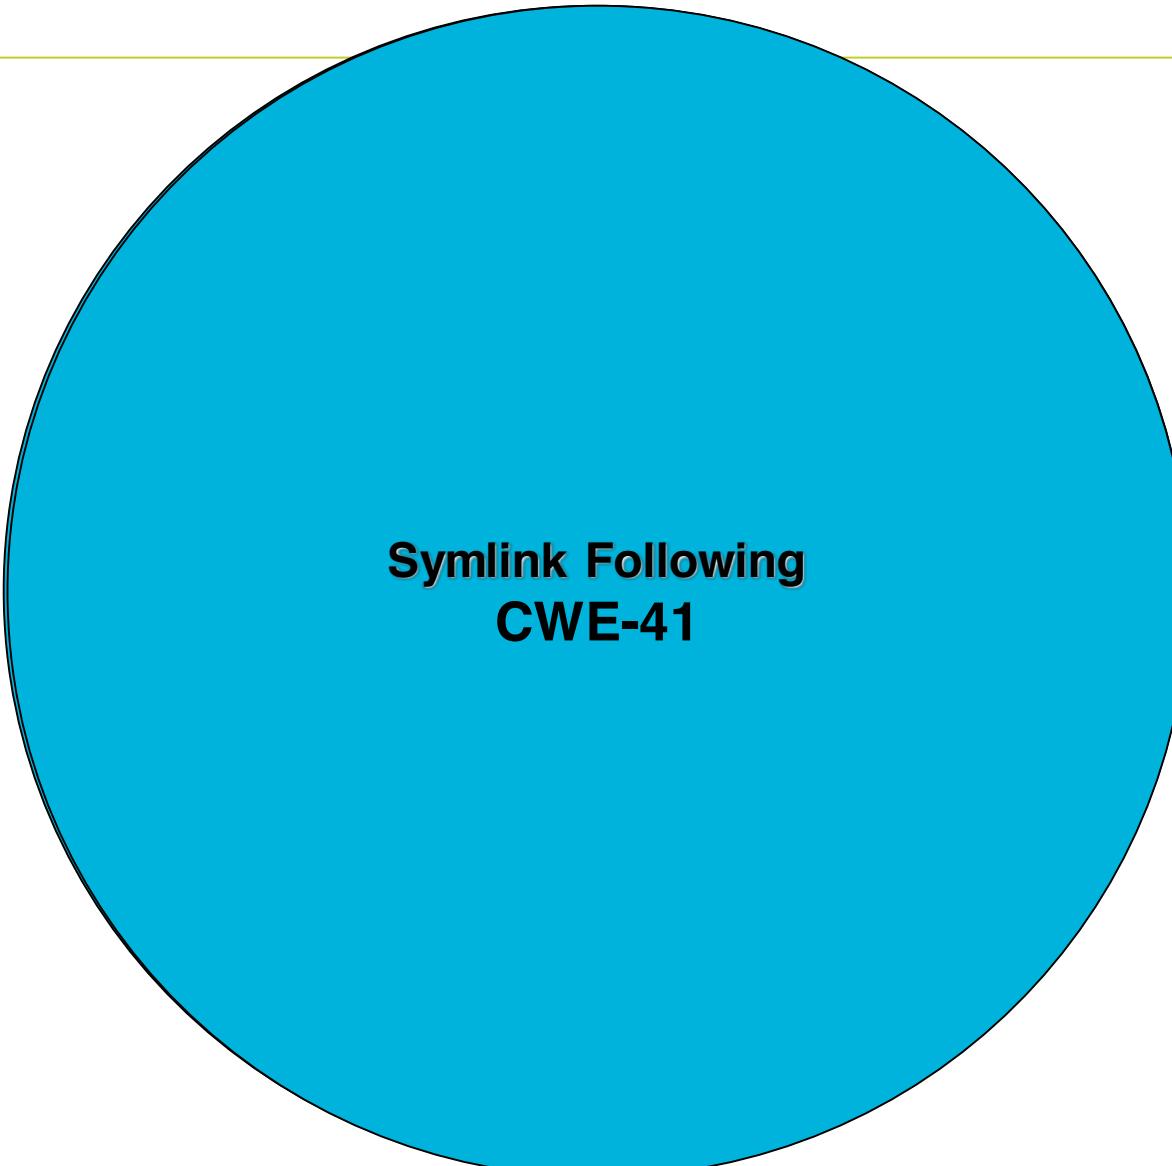

A `if (height > 64000 || width > 64000) { error("too big!"); }`

B `size = height * width;`

C `buf = malloc(size);`

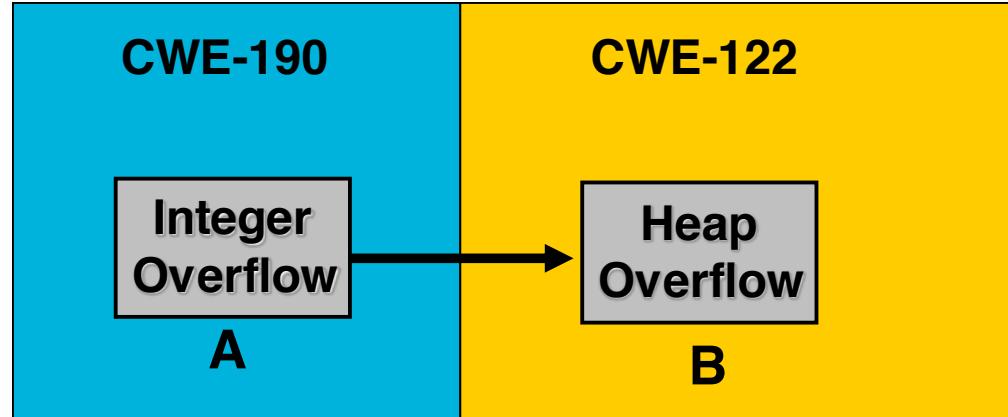

D `memmove(buf, InputBuf, SZ);`

Symbolic Link Following

**Symlink Following
CWE-41**

Named Chain Example: Integer Overflow to Heap Overflow (CWE-680)

Assumption:
height and width are reasonable sizes.

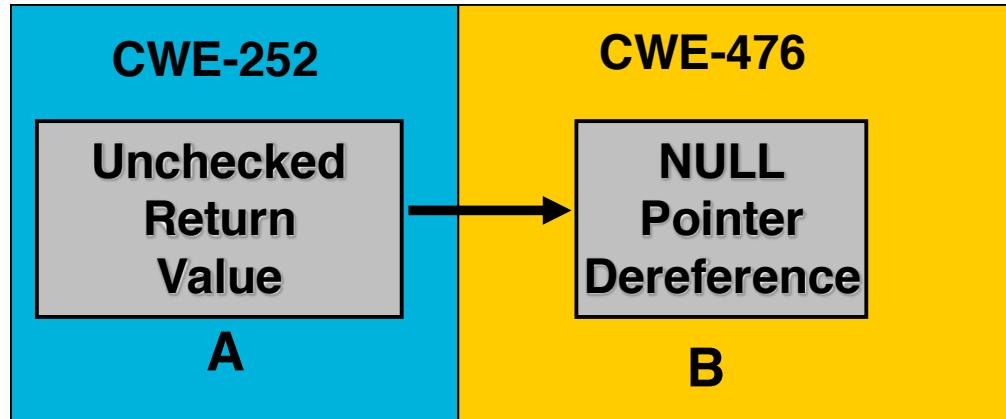

height = 65534; width = 65534

A `size = height * width;`
 `buf = malloc(size);`
 `memmove(buf, InputBuf, SZ);`

B

The buffer overflow occurs because the newly created buffer is smaller than expected, because the integer overflow causes the 'size' variable to be smaller than expected.

Named Chain Example: Unchecked Return Value to NULL Pointer Dereference (CWE-690)

Assumption:
height and width are reasonable sizes.

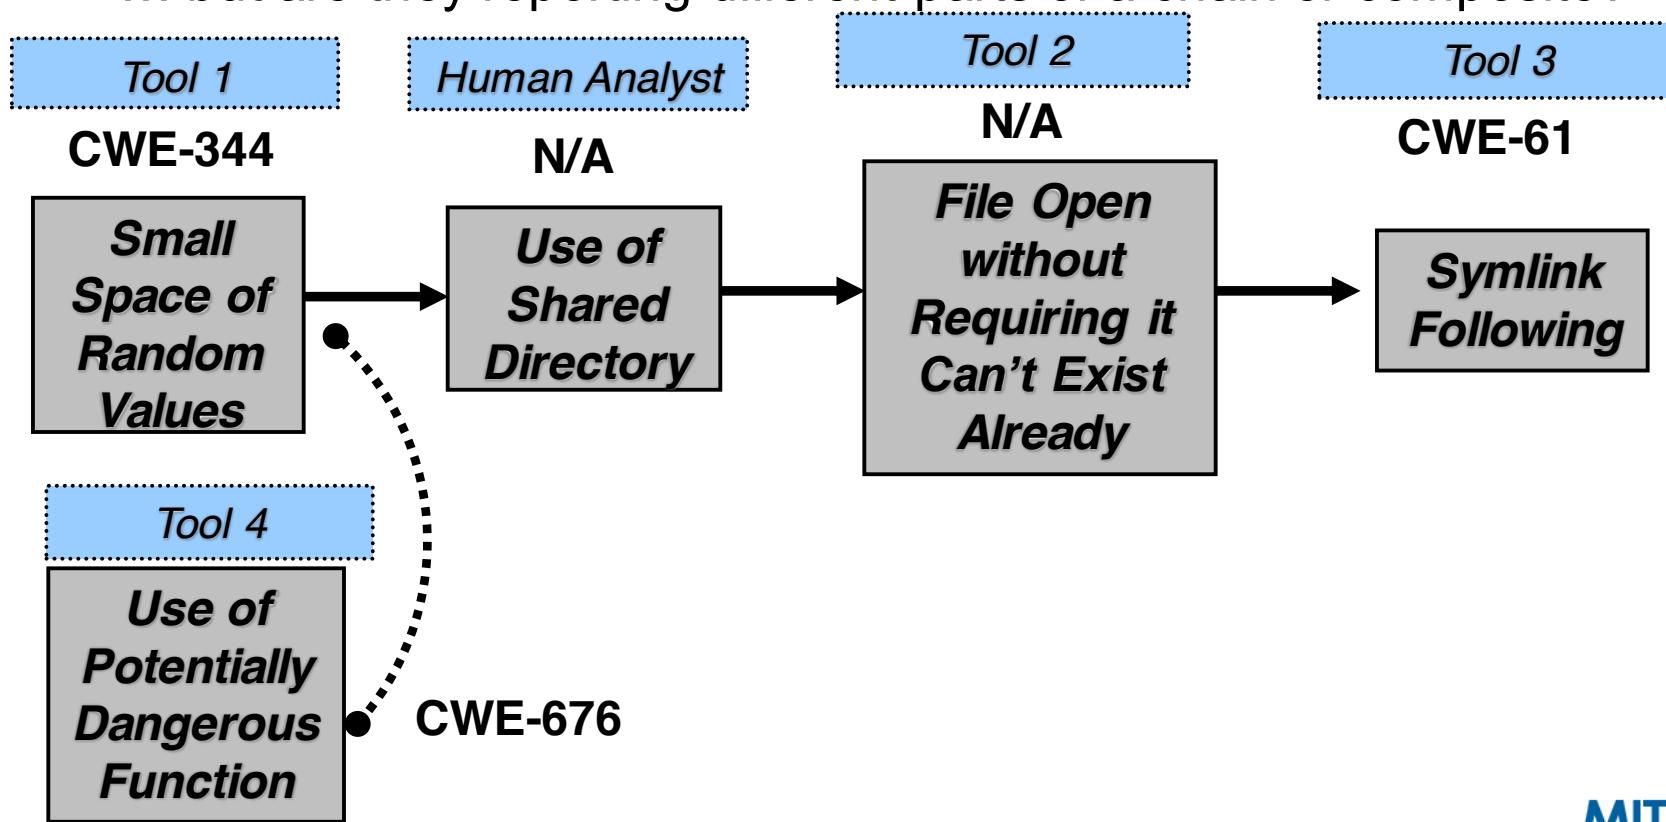

height = 63000; width = 63000

```
A    size = height * width;  
B    buf = malloc(size);  
     memmove(buf, InputBuf, SZ);
```

With properly selected height and width, an extremely large size value could cause malloc to return NULL due to out-of-memory conditions.

Chains, Composites, and Code Scanning

- Comparisons between code scanning capabilities can yield significantly different results
- Very little overlap between tools
 - ... but are they reporting different parts of a chain or composite?

The Four I's Principle of Vulnerability Information

■ Incomplete

- Missing versions, product names
- Missing patch information

■ Inaccurate

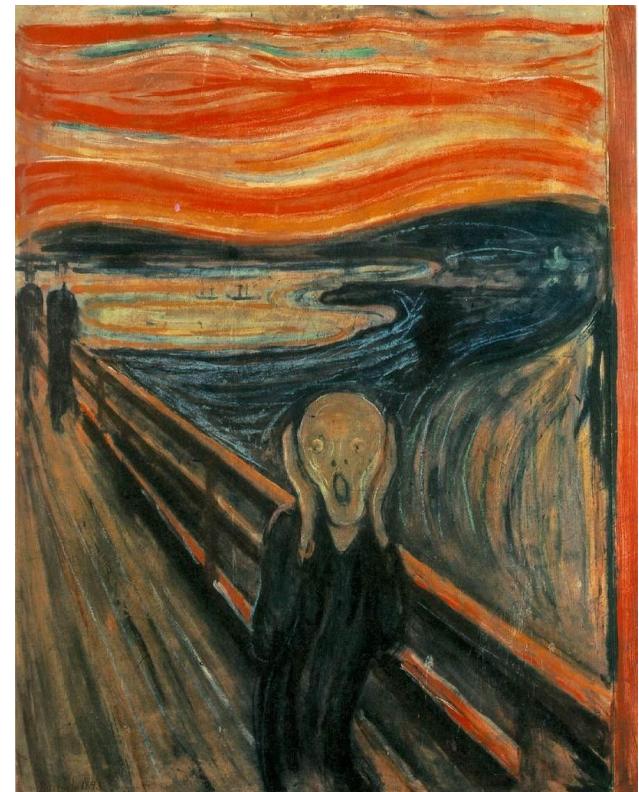

- Incorrect diagnosis
- Blatantly wrong

■ Inconsistent

- Acknowledgement discrepancies
- Bug type discrepancies
- Varying severities

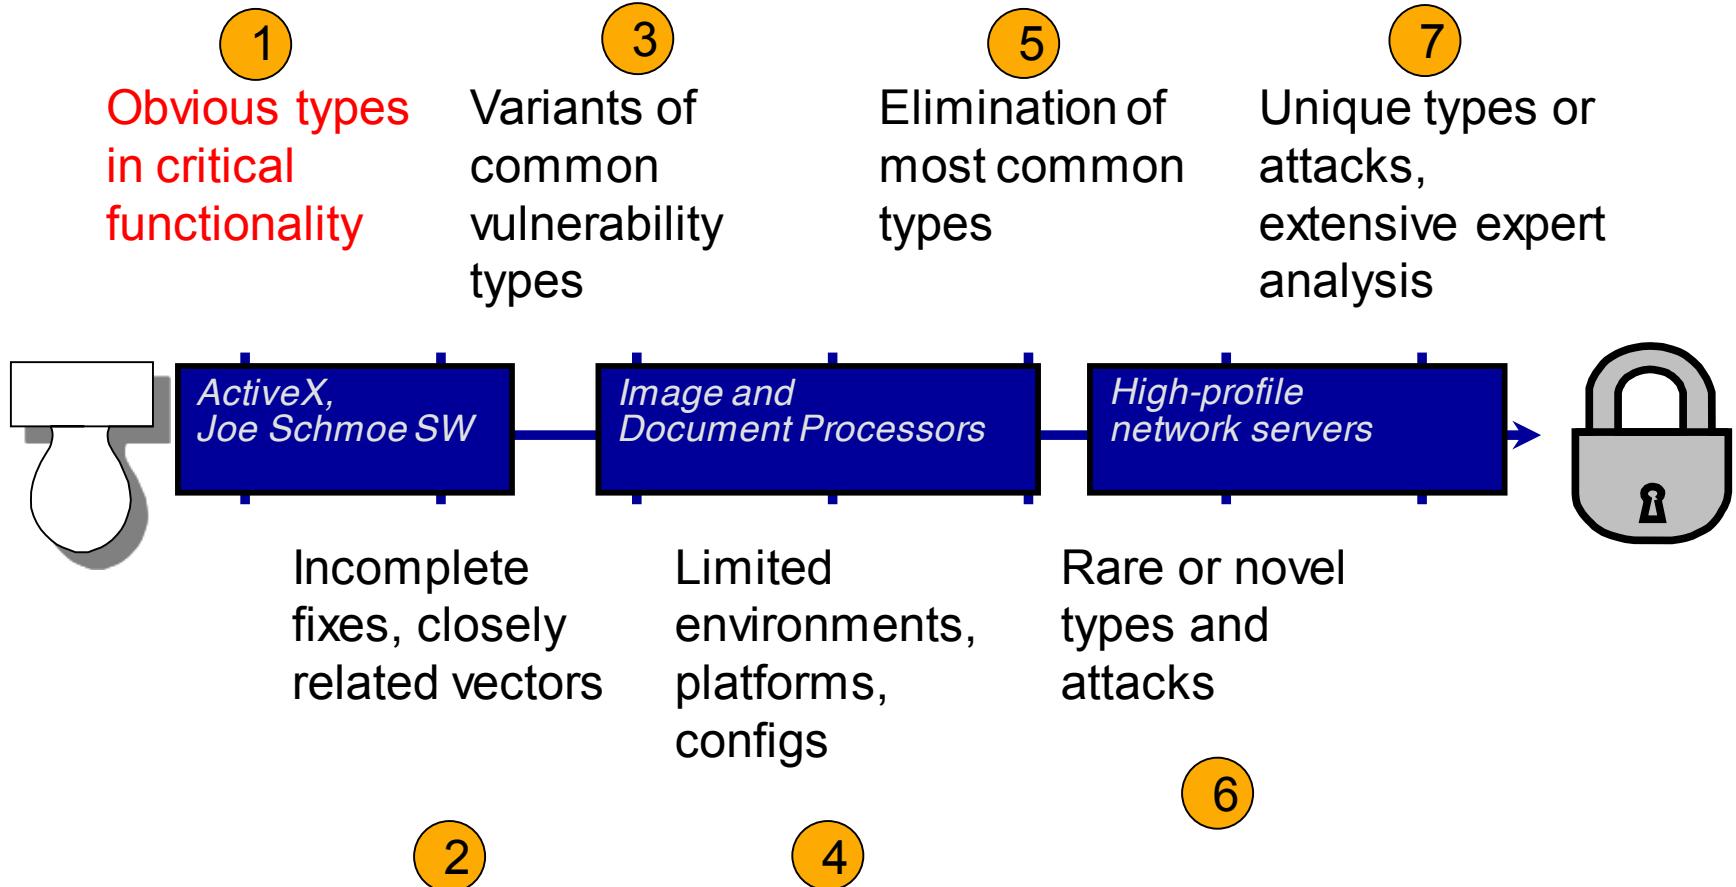

■ Incomprehensible

- Poor writing
- Lack of clear formatting

Coordinated disclosure between researcher
and vendor frequently wipes these out.

Typical Vulnerability History of a Product (Using 2007-era Examples)

2007 Theories with 2015 Applications: Things. And Stuff.

- Skateboard Bluetooth PIN guessing – property damage, human harm
- Toilet – environmental resource consumption, noise, “user inconvenience”
- Infusion pump, other medical devices – too much, too little, too late
- Coffee maker – electricity consumption, fire risk
- Voting machine – loss of confidentiality, integrity, availability, and democracy
- uConnect car entertainment system - human harm, loss of precious national resources such as Forbes journalists

Futures

- **CWE**
 - New weaknesses, variations of old themes
 - Greater emphasis on design-level and “new” product classes, e.g. mobile or medical
 - Engagement with academic community
 - Lots of potential for research!
- **CVE**
 - Low hanging fruit – gone?
 - Scale, scale, scale!
 - Automation / fuzzing
 - Massive influx of new/inexperienced researchers
 - Process changes to increase CVE output and make it more reliable
 - Focus on key products and data sources; no longer “all” vulnerabilities
- **Top 25**
 - Time for a new one?
 - But a general Top 25 can be of limited use
 - ... yet we get asked about it ALL THE TIME
 - Ideal: customizable Top 25 lists
 - Next version (or variant) in 2015

Unsolicited Career Guidance

- **Self-directed career opportunities**
 - You can find a niche
 - Many careers don't require hard-core exploits
 - Local conferences are (relatively) cheap, and you can volunteer
- **Skillz**
 - Good writing and communication are extremely rare and extremely valuable
 - Empathy (for developers, users, peers, etc.) also extremely rare and (increasingly) valuable
 - Fundamental computing and networking is helpful but not necessary?
- **Educating yourself**
 - Try to know what you don't know
 - Learn the “mindset”
 - The older generation (i.e. me) aren't necessarily doing a good job of this
 - What separates a “bug” from a “vulnerability” from a “feature?”
 - Bug bounties

CWE-937: OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

Category ID: 937 (Category) **Status:** Incomplete

Description

Description Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2013.

Relationships

Nature	Type	ID	Name	Value
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928

Relationship Notes

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')

Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')

Weakness ID: 89 (Weakness Base)

Description

Description Summary

The software constructs all or part of an SQL command using externally-influenced input from an upstream component, but it does not neutralize or incorrectly neutralizes special elements that could modify the intended SQL command when it is sent to a downstream component.

Extended Description

Without sufficient removal or quoting of SQL syntax in user-controllable inputs, the generated SQL query can cause those inputs to be interpreted as SQL instead of ordinary user data. This can be used to alter query logic to bypass security checks, or to insert additional statements that modify the back-end database, possibly including execution of system commands.

SQL injection has become a common attack vector, even a minimal user base is likely to have data planes.

Common Consequences

Scope	Effect
Confidentiality	<u>Technical Impact:</u> Read application data Since SQL databases generally hold sensitive data, loss of control over the data can lead to significant security issues.
Access Control	<u>Technical Impact:</u> Bypass protection mechanism If poor SQL commands are used to check user names and passwords, an attacker may be able to gain unauthorized access.
Access Control	<u>Technical Impact:</u> Bypass protection mechanism If authorization information is held in a SQL database, it can be modified by an attacker to grant unauthorized access.
Integrity	<u>Technical Impact:</u> Modify application data Just as it may be possible to read sensitive information, it may also be possible to modify it, leading to data corruption or other security issues.

This weakness typically appears in:

Common Consequences

Scope	Effect
Confidentiality	<u>Technical Impact:</u> Read application data Since SQL databases generally hold sensitive data, loss of control over the data can lead to significant security issues.
Access Control	<u>Technical Impact:</u> Bypass protection mechanism If poor SQL commands are used to check user names and passwords, an attacker may be able to gain unauthorized access.
